The Age of AI Agents

Everyone's talking about them. OpenClaw just crossed one and a half million agents on Telegram. Claude shipped dispatch last week. Perplexity launched computer use last month.

The promise is simple: tell your AI to do something, and it does it. Sky is the limit.

I believed that.

Made with GAMMA

Reality Check

So I installed OpenClaw. Day one. I was excited.

I said: "Make me a pitch deck."

And it tried. It really tried. It installed python-pptx from the command line, it wrote slides in code, it generated a .pptx file.

And when I opened it...

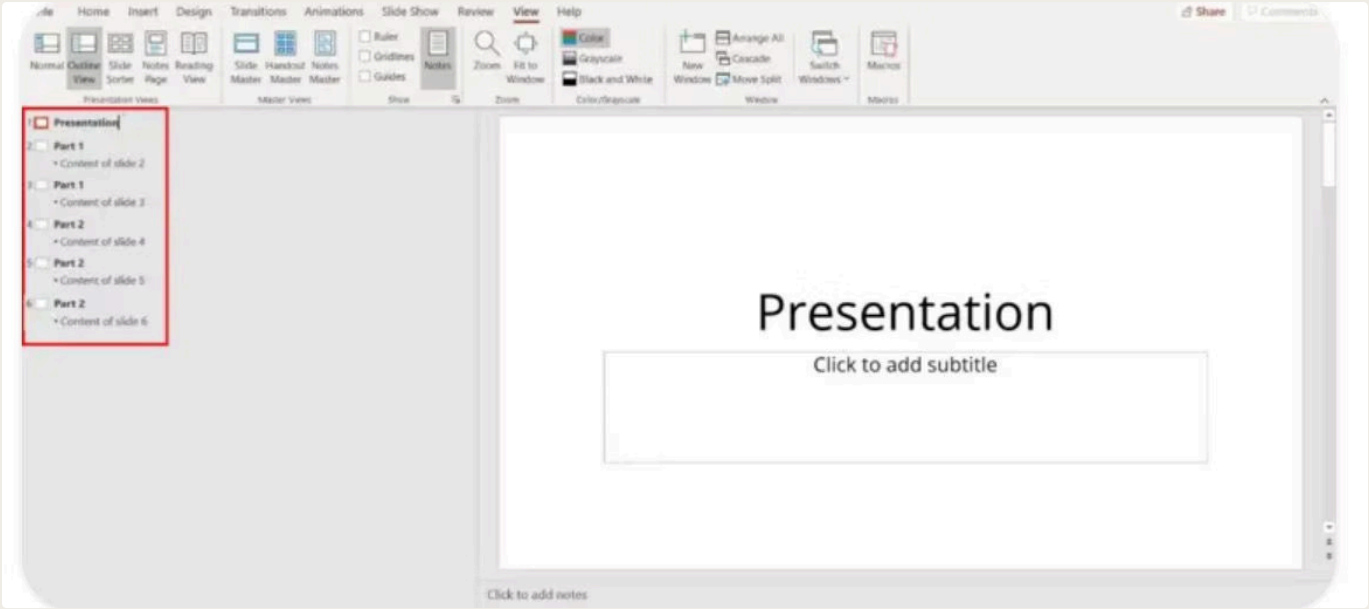
White background. Default font. No images. No layout. No design.

This is what "sky is the limit" looks like in practice.

Made with GAMMA

The Quality Gap

OpenClaw Native Output



White background. Default font. No images. No layout. No design.

Same prompt. Left side: what the agent built by itself. Right side: what a specialist with Gamma Pro credentials delivers.

It's not even close. It's not a 10% difference. It's a completely different product.

Video Editing

Amateur cuts vs professional colour grading and transitions

3D Rendering

Basic geometry vs photorealistic models with lighting

Data Visualisation

Default charts vs custom interactive dashboards

The agent can hack its way through, but the output is... amateur.

Made with GAMMA

Pass the Baton

Agent Baton Protocol

The idea is simple. When your agent hits a wall (often), instead of failing, instead of delivering garbage — it passes the baton to a specialist agent that already has the tools, the credentials, the infrastructure, and the expertise.

Discover

Find who can do the work

Delegate

Send task, lock payment

Deliver

Get pro-quality result

Settle

Release payment or refund

The specialist does the work. Gets paid in TON. Through an on-chain escrow smart contract. Trustless. No middleman.

Made with GAMMA

What Agents Can't pip install

Credentials

You can't pip install a Gamma API key. Pro tools require accounts, subscriptions, licences. Agents don't have wallets to pay for them.

Infrastructure

You can't pip install a GPU. Video editing, 3D rendering, ML training — they demand serious compute. Local machines choke on this work.

Expertise

You can't pip install ten years of 3D rendering experience. Best practices, shortcuts, aesthetic judgment — that's human knowledge.

Installation is 20% of the problem. The other 80% is everything the agent just... doesn't have.

Made with GAMMA

Four Primitives

The entire protocol is four steps. Four verbs. Simple as HTTP.

01

Discover

Find who can do the work. Registry of specialists with capabilities and pricing.

02

Delegate

Send the task, lock TON in escrow. Smart contract guarantees payment on delivery.

03

Deliver

Specialist returns the result. Quality checked, validated, ready to use.

04

Settle

Confirm, release payment. Or dispute, get a refund. Code enforces fairness.

Live Demo

Watch what happens.

1 — Message Sent
User request received

2 — Delegating...
TON locked in escrow

3 — ~10 Seconds
Specialist renders model

4 — File Delivered
GLB model received

The agent found a specialist with GPU and Trellis 2. Locked TON in escrow. The specialist picked up the job, rendered the model, delivered it.

Ten seconds. One message. Photorealistic 3D model.

And in the Telegram Mini App, the user sees their wallet, their spending, the job in their history. Everything tracked.

The user typed ONE sentence. They don't know what an MCP server is. They don't know what an API is. They don't know there's a smart contract on TON behind the scenes. They just know: **they asked, and they got a pro-quality result.**

Made with GAMMA

The New Mental Model

A normal person — not a developer, not a crypto native — tries to get something done with ChatGPT. A pitch deck. A 3D model. A video edit.

It fails. Or it's ugly. Or it takes fifteen tries.

So they hear from a friend: "Try it on Telegram."

They open Telegram. They type the same thing. **And it works. First try. Professional quality.**

They don't know there's an MCP server. They don't know there's a specialist agent with GPU access. They don't know there's a smart contract settling payment on TON. They don't know what any of those words mean. And they never will.

All they know — all they map in their head — is:

"ChatGPT couldn't do it. Telegram could."

That's it. That's the mental model. And once that's in someone's head, they never go back.

Made with GAMMA

The Currency of Getting Things Done

Now. What does that person need to make Telegram work?

TON

Not because they care about blockchain. Not because they read a whitepaper. Because their Telegram agent needs three TON to get them a 3D render. Five TON to get them a pitch deck. One TON for a logo.

So they buy TON. The same way they buy credits on any platform. Except this isn't one platform — this is every agent, every specialist, every task.

950M

Telegram Users

Each discovering complex work just... works now

100%

Adoption Curve

Users buying TON to fuel every task

∞

Use Cases

Every agent, every specialist, every creative need

TON stops being a crypto token. **TON becomes the currency of getting things done.**

And when every agentic transaction in the world's largest messaging app settles in TON...

You don't need to speculate on what happens to the market cap.
